Integrated Pest Management for the Potato Leafhopper in Alfalfa

Elissa Chasen
WI Crop Management Conf.
Jan. 16, 2013
WI Alfalfa in numbers

2011

• 1.5 million acres of dry alfalfa hay harvested (USDA NASS, 2012)

• 430,000 acres seeded (USDA NASS, 2012)

• Between 2\textsuperscript{nd} and 3\textsuperscript{rd} largest crop by acreage (USDA NASS, 2011 and 2012)
Crop Value (WI only)

$/ton

Source: Gould, B. 2012. Understanding Dairy Markets
Potato leafhopper

- Most economically damaging pest for alfalfa, after 1st crop

- Reduces yield, forage quality, and stand longevity
Integrated Pest Management

- Host plant resistance
- Biological control
- Cultural controls
- Physical control
- Monitoring pest abundance
- Economic thresholds for chemical control
Current Alfalfa IPM

- Monitor for potato leafhopper
- Insecticide sprays at current economic threshold (ET)
- Early harvest if ET is reached within 7 days of planned harvest

UW Extension Publication A3646
Alfalfa IPM

• Resistant alfalfa cultivars with glandular hairs released 1997
  – Ability to tolerate greater PLH pressure in established stands (Lefko et al. 2000)
Alfalfa IPM

• Cultural practice of grass intercrops with alfalfa

- Orchardgrass and bromegrass can significantly reduce PLH abundance (Roda et al. 1997, Degooyer et al. 1999)

- Grasses also promoted as an intercrop for increased digestible fiber in dairy rations (Lee, 2011)
Study System
Present Study

• 2010-2012 at Arlington Ag Research Station (AARS)

• 2012 spring and fall seeded at US Dairy Forage Research Center (DFRC)
Methods

- Weekly sampling 20 sweeps
- Pyrethroid (a.i. lambda-cyhalothrin) applied at 1.6 oz/acre when PLH has reached 1/2 ET and ET, to respective split plot treatments (only AARS)

IPM system and yield

- The first cutting of the seeding year had lower yield in plots with orchardgrass.
- The first cutting of the production year had higher yield in plots with orchardgrass.
- Resistant alfalfa had comparable yield with susceptible alfalfa in 3 of the 5 cuttings but expressed yield drag in 2 of 5.

IPM system and NDF

- Plots with grass had higher NDF
- Susceptible alfalfa sometimes had higher NDF content than resistant alfalfa
Potato leafhopper and NDF

PLH decreased NDF on July 5, 2011 (p=0.02)
Trial layout at DFRC
Effect of seeding on PLH at DFRC
Effect of seeding and alfalfa variety
Summary

• Only 1 of the 5 cuttings presented experienced economically damaging PLH populations.
• Potato leafhoppers only had an impact on yield when economic threshold populations were reached.
• Resistant alfalfa significantly suppressed potato leafhopper in the seeding year even when pest pressure was low.
• The effect of orchardgrass intercropped with alfalfa on potato leafhoppers was minimal.
Ongoing work

• Plans to cage PLH this coming summer at DFRC to artificially create economically damaging populations and better understand the insect-injury crop-damage response
